Risks to Forests

Problem Statement

- Working forests have an important role to play in maintaining ecosystem services
- Modeling provides general guidance on future conditions but is rarely sufficient to support local management decisions
- Managing forests in a dynamic climate will require monitoring of variables beyond those typically tracked in relation to growth and yield

Objectives

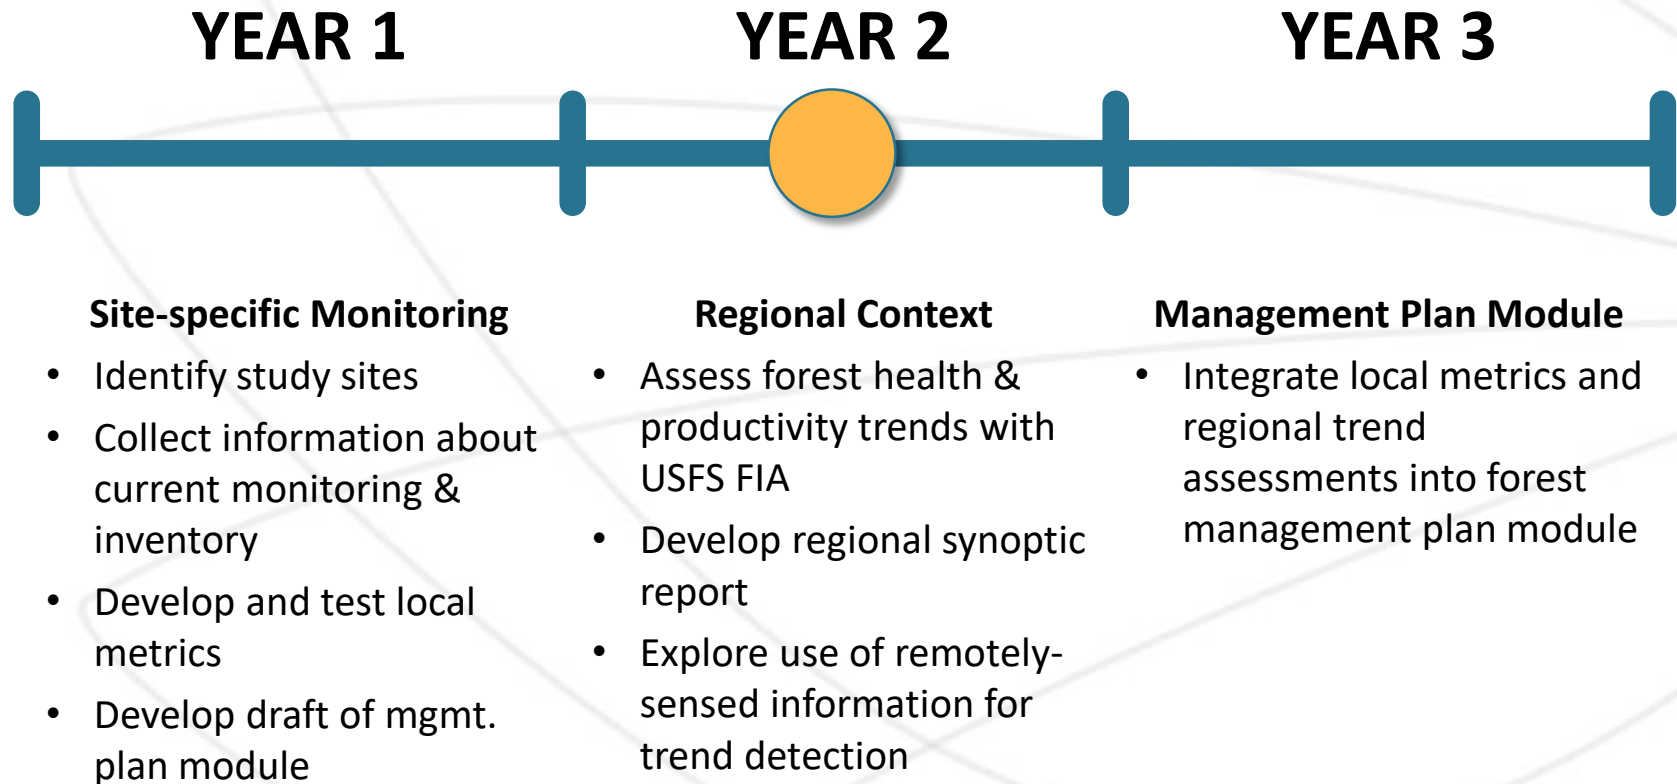

- Identify a set of metrics that balance utility and level of effort
- Leverage existing monitoring practices
- Link monitoring data to planning and management

Approach

Two-tiered approach:

- (1) locally relevant metrics
- (2) an assessment of the larger regional context

Page 2 of 2

Preliminary Findings

How is forest health changing?

- Crown condition
- Insect/disease damage
- Tree Mortality

How is relative tree species abundance changing?

- Regeneration success
- Species abundance

How are growth rates changing by species (or species group)?

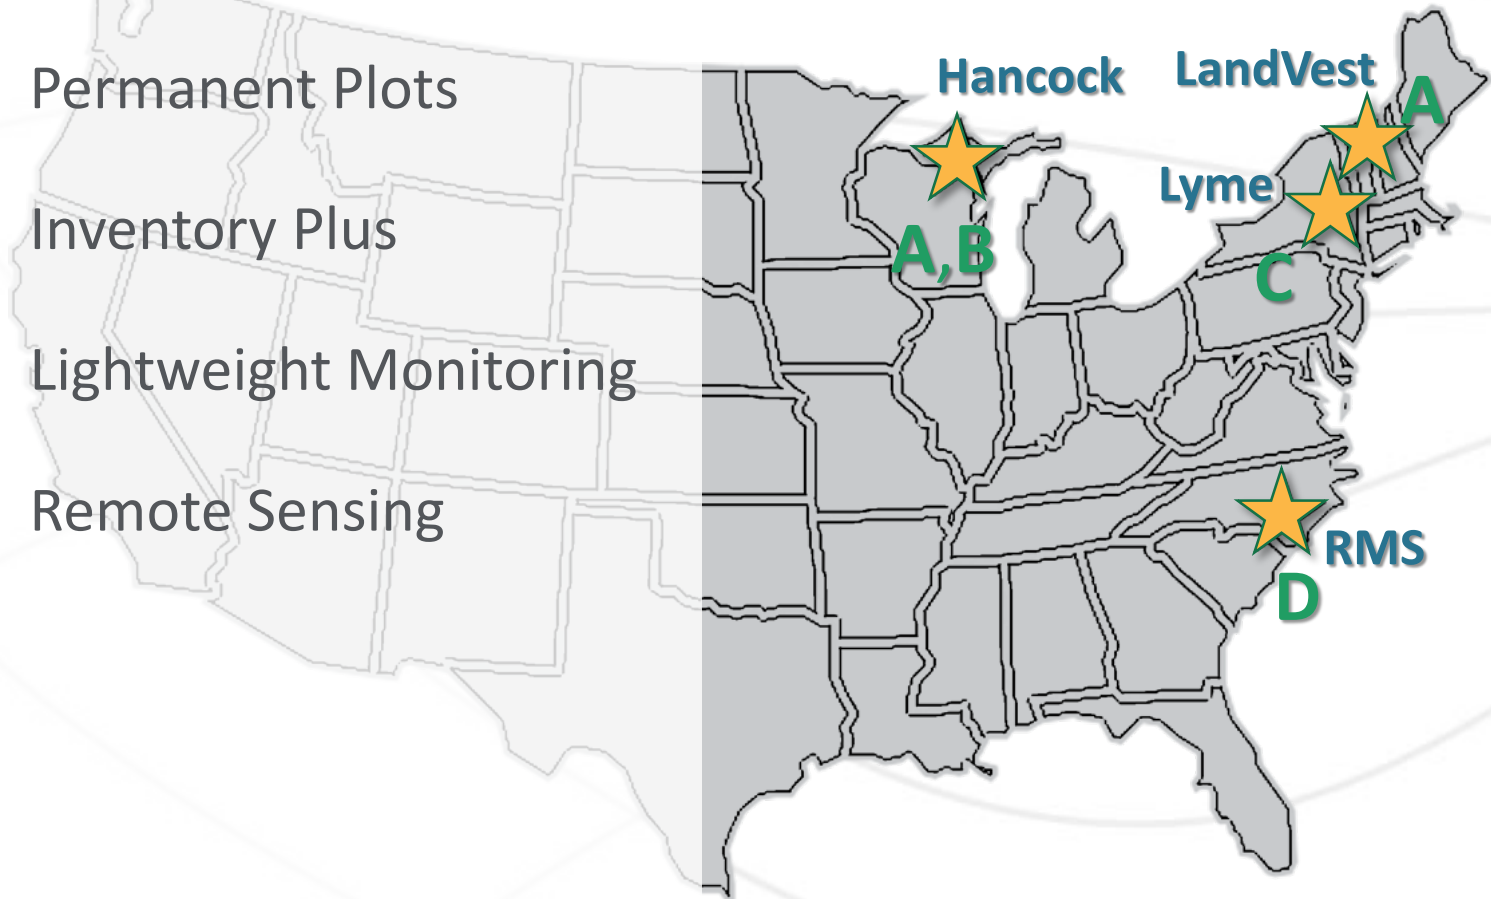

- Net annual growth
- Ingrowth vs. mortality

Next Steps

These questions can be assessed at different levels:

- A. Permanent Plots
- B. Inventory Plus
- C. Lightweight Monitoring
- D. Remote Sensing

Permanent Plots

Image credit: Maria Thi Mai on Flickr

Image credit: NASA/ Kate Ramsayer on Flickr

Lightweight Monitoring

- Tree vigor/forest canopy health
- Pests and pathogens
- Browse
- Invasive plants

Remote Sensing

Next Steps

- ✓ LOCAL:
 - Refine and vet metrics & assessment levels with project partners
- ✓ REGIONAL CONTEXT:
 - Manomet compiling data for regional snapshots from USFS FIA & remote sensing
